

IN THE CLAIMS

Please amend the claims as follows:

1. (Withdrawn-Currently Amended) A method for depositing metal on a semiconductor device having a substrate, an exposed first layer surface, and an exposed second layer surface, comprising:

 depositing metal ions on the exposed first layer surface and on the exposed second layer by applying a first voltage between the substrate and an anode in the presence of an electrolytic bath; and

 removing metal ions from the exposed first layer surface by applying a second voltage between the substrate and the anode in the presence of the electrolytic bath.
2. (Withdrawn-Currently Amended) The method of claim 1, wherein the exposed first layer surface has a first potential and the exposed second layer surface has a second potential.
3. (Withdrawn) The method of claim 1, wherein the semiconductor device includes an insulator layer between the first layer and the second layer, the method further comprising placing a first potential on the first layer and placing a second potential on the second layer.
4. (Withdrawn) The method of claim 1, wherein the metal ions include copper ions.
5. (Withdrawn) The method of claim 1, wherein applying a first voltage and applying a second voltage includes applying a bipolar modulated voltage between the substrate and the anode.
6. (Withdrawn-Currently Amended) A method for depositing copper on a semiconductor device having a substrate, an exposed first layer surface, and an exposed second layer surface, comprising:

 providing a voltage with a positive duty cycle between the substrate and an anode in the presence of an electrolytic bath containing copper ions to deposit copper ions on the exposed first layer and the exposed second layer during the positive duty cycle; and

providing a voltage with a negative duty cycle between the substrate and an anode in the presence of the electrolytic bath to remove copper ions from the exposed first layer during the negative duty cycle.

7. (Withdrawn) The method of claim 6, wherein the exposed first surface has a first potential and the exposed second surface has a second potential.
8. (Withdrawn) The method of claim 6, wherein the semiconductor device includes an insulator layer between the first layer and the second layer, the method further comprising placing a first potential on the first layer and placing a second potential on the second layer.
9. (Withdrawn) The method of claim 6, wherein the first layer comprises polysilicon and the second layer comprises titanium nitride.
10. (Currently Amended) A method for depositing metal on a semiconductor device having a substrate, an exposed first layer ~~surface~~, and an exposed second layer ~~surface~~, comprising:
 - placing the semiconductor device in an electrolytic bath;
 - applying a first voltage between the substrate and an anode, the first voltage being sufficient to deposit metal ions on the exposed first layer and the exposed second layer; and
 - applying a second voltage between the substrate and the anode, the second voltage being sufficient to remove metal ions from the exposed first layer and retain metal ions on the exposed second layer.
11. (Original) The method of claim 10, wherein the metal ions include copper ions.
12. (Original) The method of claim 10, wherein the metal ions includes nickel ions.
13. (Original) The method of claim 10, wherein the metal ions includes palladium ions.

14. (Original) The method of claim 10, further comprising placing a third voltage on one of the exposed first layer and the exposed second layer.
15. (Original) The method of claim 14, further comprising placing a fourth voltage on the other of the exposed first layer and the exposed second layer.
16. (Currently Amended) A method for depositing metal on a semiconductor device having a substrate, an exposed first layer surface, and an exposed second layer surface, comprising:
placing the semiconductor device in an electrolytic bath containing metal ions; and
applying a bipolar modulated voltage between the substrate an anode, the bipolar modulated voltage having a first duty cycle and a second duty cycle to deposit metal ions on the exposed first layer and on the exposed second layer during the first duty cycle and to remove metal ions from the exposed first layer and retain metal ions on the exposed second layer during the second duty cycle.
17. (Original) The method of claim 16, wherein the first duty cycle provides a potential difference between the anode and the first and second layers that exceeds a reduction potential of the metal, and the second duty cycle provides a potential difference between the anode and the first layer that is less than a reverse deposition potential of the metal.
18. (Original) The method of claim 16, further comprising applying a first potential on one of the first layer and the second layer.
19. (Original) The method of claim 18, further comprising applying a second potential on the other one of the first layer and the second layer.
20. (Original) The method of claim 16, wherein applying a bipolar modulated voltage includes applying a square wave.

21. (Currently Amended) A method for depositing copper on a semiconductor device having a substrate, an exposed first layer surface, and an exposed second layer surface, comprising:
placing the semiconductor device in an electrolytic bath containing copper ions; and
applying a bipolar modulated voltage between the substrate an anode, the bipolar modulated voltage having a first duty cycle and a second duty cycle to deposit copper ions on the exposed first layer and on the exposed second layer during the first duty cycle and to remove copper ions from the exposed first layer and retain copper ions on the exposed second layer during the second duty cycle.

22. (Original) The method of claim 21, wherein the first duty cycle provides a potential difference between the anode and the first and second layers that exceeds a reduction potential of the copper, and the second duty cycle provides a potential difference between the anode and the first layer that is less than a reverse deposition potential of the copper.

23. (Original) The method of claim 21, further comprising placing a first potential on the first layer and a second potential on the second layer prior to applying the bipolar modulated voltage.

24. (Original) The method of claim 21, wherein applying a bipolar modulated voltage includes applying time-varying waveform selected from a group of waveforms consisting of: a square wave, a triangle wave and a sinusoidal wave.

25. (Withdrawn-Currently Amended) A method for depositing nickel on a semiconductor device having a substrate, an exposed first layer surface, and an exposed second layer surface, comprising:
placing the semiconductor device in an electrolytic bath containing nickel ions; and
applying a bipolar modulated voltage between the substrate an anode, the bipolar modulated voltage having a first duty cycle and a second duty cycle to deposit nickel ions on the exposed first layer and on the exposed second layer during the first duty cycle and to remove

nickel ions from the exposed first layer and retain nickel ions on the exposed second layer during the second duty cycle.

26. (Withdrawn) The method of claim 25, wherein the first duty cycle provides a potential difference between the anode and the first and second layers that exceeds a reduction potential of the nickel, and the second duty cycle provides a potential difference between the anode and the first layer that is less than a reverse deposition potential of the nickel.

27. (Withdrawn) The method of claim 25, further comprising placing a first potential on the first layer and a second potential on the second layer prior to applying the bipolar modulated voltage.

28. (Withdrawn) The method of claim 25, wherein applying a bipolar modulated voltage includes applying time-varying waveform selected from a group of waveforms consisting of: a square wave, a triangle wave and a sinusoidal wave.

29. (Withdrawn-Currently Amended) A method for depositing palladium on a semiconductor device having a substrate, an exposed first layer surface, and an exposed second layer surface, comprising:

placing the semiconductor device in an electrolytic bath containing palladium ions; and
applying a bipolar modulated voltage between the substrate an anode, the bipolar modulated voltage having a first duty cycle and a second duty cycle to deposit palladium ions on the exposed first layer and on the exposed second layer during the first duty cycle and to remove nickel ions from the exposed first layer and retain palladium ions on the exposed second layer during the second duty cycle.

30. (Withdrawn) The method of claim 29, wherein the first duty cycle provides a potential difference between the anode and the first and second layers that exceeds a reduction potential of the palladium, and the second duty cycle provides a potential difference between the anode and the first layer that is less than a reverse deposition potential of the palladium.

31. (Withdrawn) The method of claim 29, further comprising placing a first potential on the first layer and a second potential on the second layer prior to applying the bipolar modulated voltage.

32. (Withdrawn) The method of claim 29, wherein applying a bipolar modulated voltage includes applying time-varying waveform selected from a group of waveforms consisting of: a square wave, a triangle wave and a sinusoidal wave.
